You can move, edit, and manipulate each layer as you please. Figure 2-1 illustrates an image that has been manipulated. FIGURE 2-1: No matter what you may say about Photoshop, this figure is pretty. One of Photoshop's biggest advantages is its ability to let you combine raster (bitmap) images with vector (scanned) images. In the following sections, we show you how to work with vector-based images as well as the fundamental steps of combining a vector-based image with a raster image. ## Understanding Vector Images As its name implies, a vector-based image is a picture made up of shapes — such as lines, curves, or circles — that you can easily create and manipulate. Vector graphics became the standard in the graphic arts because they're as easy to manipulate as they are to print or display. When you create a vector image, you use lines, curves, and shapes to create a picture. Figure 2-2 illustrates a vector-based image. You use vector graphic tools to draw the image. FIGURE 2-2: Vector graphics use lines, curves, and shapes to create a picture. ## Adding Vector Files to a Photo The first step in working with a vector-based image is to add the vector file to the Photoshop document. Then you create a new layer and make changes to the vector image. To add a new layer in Photoshop, click New on the Layers panel. Then choose Layer via the New Layer button at the bottom of the Layers panel. Figure 2-3 shows the New Layer icon. FIGURE 2-3: To add a new layer, click New on the Layers panel and choose Layer from the menu. If you prefer to use a vector image of a different type instead, such as a line drawing, you can do so by using the pen tool. To access the pen tool, right-click anywhere on the

Genetic aspects of essential tremor. A family is described in which the pattern of inheritance of essential tremor appears to follow a dominant mode of inheritance. Segregation analysis in this family does not confirm this assumption, however. Analysis of peripheral blood chromosomes in three kindreds revealed the mode of inheritance in two of these to be autosomal recessive, but not in the third. These results suggest that the disease in two of the kindreds may represent two different disorders, one autosomal dominant and one autosomal recessive. The disorder in the third kindred is a variant of essential tremor in which a dominant mode of inheritance is observed. The modes of inheritance of the autosomal dominant and recessive forms of the disease in these kindreds are not predictable on the basis of known genetic mechanisms.Image caption The case of the Radisson case is included in the report The public should be told when a judicial ruling is made allowing access to terrorist trial documents, the Judicial Council says. The report, published by the council, calls on judges to inform the public when they rule they will not be naming names of the individuals under investigation. The move is aimed at protecting the identities of those accused of terror offences. The council's chairman, Lord Phillips, said the public should know what was going on. It comes after details of the Osama Bin Laden trial were leaked in the media. The names of alleged 9/11 bombers were named in a classified document in a case brought by relatives of those killed in the 2001 al-Qaeda attacks. Lord Phillips said the report was intended to reassure the public that its right to know was being maintained. He added that the process of judicial review in which judges review decisions made by a court was an "expensive and lengthy" process and that it would be "expensive and lengthy" to inform the media and the public what the court was thinking. 'High risk' The cases involving the Radisson case has been a matter of public debate due to fears that people could be incriminated by making false statements about the case. The report said the process of judicial review "is conducted in secrecy and can last several years, during which the public has no insight into the business of the court". "This has the potential to have serious consequences when the court is reviewing the decision of a specialist criminal court which has an international reputation for conducting criminal cases against terrorists in a fair manner," it added. Q: What is the mindset that allows a surgeon to break a leg? It often comes as a surprise to laypeople that doctors are able to break bones. I imagine that there are several factors that play into this, such as the size of the tools and that the instruments are sterile. I'd like to understand what the mindset is to be able to think about breaking something, and to do so repeatedly without injuring oneself. A: I am a surgeon in the UK. We use power tools that are not used outside of cutting bone. For example, the high-speed saws used for breast reduction surgery require a maximum power limit of 7500w or equivalent in the US. Our saws can cut bones (the tibiae) with an equivalent power of 4500w. We have started using drills in similar power ranges; however, we have yet to use this on the femur as our osteoplastic systems can only ever have crossed a single cortex. We never damage osteoplastic systems. We do this because we are cutting through bone and there is inevitably going to be some damage to the bone structure. It is the normalization of that damage that we use osteoplastic systems for. In other words, our mindset is to be the best surgeons that we can and we expect the equipment to do its job. A: A good example of broken bones is when doctors are working with some small magnets which is something that most people have experienced. When magnets are brought close together, it can pull apart the metal rods of a screw. How does a doctor do that without losing a finger? Doctor has a pretty sharp knife How else is this technique possible? It usually results from magnetism. A conductor has polarity, positive and negative, and the magnets have the same if they have poles. Each magnet has its own polarity, and when they are near each other, they repel each other. Surgeons use magnets for a few reasons: There is no heat It's quick No mess It's sterile In his degree thesis, Marcin Lewandowski (2011) shows the use of electromagnets to split the femur into two parts: There are multiple ways to do this: The power of a magnet is equal to $5 * M * V$, where M is the magnetic moment of the magnet, and
